Purpose:	
<ul style="list-style-type: none">• softens and moisturizes the skin,	

- protects the skin from aggressive external factors,
- has an antibacterial effect,
- promotes faster healing of small wounds,
- gives the skin firmness and elasticity,
- suitable for daily use,
- has a rejuvenating effect.

Ingredients

Purified water, methyl cocoyl taurate, sodium cocamidopropyl betaine, sodium cocoamphoacetate diethanolamide of coconut fatty acids, styrene \ acrylate copolymer, acrylate palmet-25 acrylate, glycerol, bioflavolipidny complex "Aktivitin" Polyquaternium 7, triethanolamine, methylisothiazolinone and Methylchloroisothiazolinone, peptide complexes of A-4, A-6, perfume.

Main components

Aktivitin

For thousands of years, traditional medicine has been using natural preparations from plants, animal and mineral origins. Typically, in traditional practice medical plants were used which were growing in the regions inhabited by the patients, which has a deep natural-scientific justification: the nature of their own means of ensuring the survival and stability of their own biocenosis.

Developed and tested technology of the original two-phase extracts from medical plants of northern and central Russia (sage, chamomile, calendula, St. John's wort), known bioflavolipid complex AKTIVITIN

In extracts which are commercially available, including alcohol, propylene glycol, oil, carbon dioxide, etc., the composition of the biologically active substance is determined by their solubility in the extractant and significantly differs from that of BAS in the native plant.

Unlike known extracts in bioflavolipid AKTIVITIN complex, biologically active substances contained in the characteristic of the plant, given the nature of the ratio which provides the most pronounced beneficial effect.

Collection of plants for bioflavolipid complex AKTIVITIN did not happen by chance. Analysis of the literature and our own extensive experimental data on the composition demonstrated that biphasic extract which is obtained from these plants contains an exceptionally wide range of biologically active substances: as lipophilic (chlorophylls, carotenoids, phytosterols, terpenoids, vitamins soluble) and hydrophilic (bioflavonoids, tannins, soluble vitamins), which provide a comprehensive curative effect on the problem of how to reduce skin-inflammatory response, solves the problem of vitamin nutrition, hydration, regeneration, antioxidant and antimicrobial protection, improve skin turgor, and the body as a whole.

Bioflavolipid Aktivitin complex is widely used in cosmetic products, manufactured by the company.

Form release:

150 ml

Production

Scientific and Production Center of Revitalization and Health

St. Petersburg University of Bioregulation and Gerontology
